

13.5 Esta formula es electe pero polinouris de grado \(\sigma_1\),
plus aligine do conservantemente les \(\tilde{\chi} \), podemos
lograr que tenga precisión \(2M - 1 \). Sea Pun polinomis de grado 2n-1. Bo dividi mos por el polinomis de Begendre de grado m, Pm: P(-n) = Or (n) Pn(n) + n(n) on Q(x) je (x) polinomis de godo = n-1 Como Or (x) sa grado < m-1, repuede escribi como polimación lineal de polimonios de Bogendie de hosta prodo M-1: M-1 Q(z) = Z di Pi(x) Sutrice : $\int P(n) dn = 2 \int P(x) P_n(x) dx + \int R(n) dx = 2 \int P(x) dx = 2 \int P(x) dx + \int P(x) dx = 2 \int P(x) dx = 2 \int P(x) dx = 2 \int P(x) dx + \int P(x) dx = 2 \int P(x) dx = 2 \int P(x) dx + \int P(x) dx = 2 \int P(x) dx = 2 \int P(x) dx + \int P(x) dx = 2 \int P(x) dx + \int P(x) dx = 2 \int P(x) dx + \int P(x) dx = 2 \int P(x) dx + \int P(x) dx = 2 \int P(x) dx + \int P(x) dx = 2 \int P(x) dx + \int P(x) dx + \int P(x) dx = 2 \int P(x) dx + \int$ = [(\(\frac{\text{\subset}}{2} \dip(n) \) Pm(\(\alpha\) dx + [\(\text{\text{\subset}}(\alpha) \da = \) - Z difpi(a)Pm(x)dr+fk(x)dr Como les polisonis de Coegendre sur ortogrenob, resulte: [1] Pi (2) Pn (2) dx = P, i=0,1,-, m-1 $\int P(x)dx = \int R(x)dx = \sum_{i=1}^{M} ciR(xi)$ Je que la formula s'exacte pere pol. de grado n-1

```
Simpson M=2 5(h=0,4) = ly [f(no) +4 f(x,)+
            + f(22)] = 0,4 [f(48) 4-4 f(2,2) + f(2,6)]=
            = 5,034204
   M=4 5 (h=0,2) = 5,032002
Romberg:
   5,434256
   5,134342 5,034204
   5,088337 5,033002 5,032922
Sea chora stimer I = In xdx (= May 1575021
 7 roperis rimple: T(h=8) = 4 [f(20) +f(21)]=
          = 8,288898
  eur: f(x)= ex f'(z)= 1/2 f"(x)=-1/2
    | E7 | 5 h3 mar | f 11(2) | = 63 mer 1 5
          < h = 42,67
    rendades en : |11,775021 - 8,78898 = 2,986123
